10 May 2026

The past year has been an exercise in figuring things out without a net. As the sole engineer across three concurrent production engagements at Cisco, I scoped requirements directly with client stakeholders, made architecture decisions without a technical safety net, and shipped systems that are still running in production. That experience taught me how to move fast on ambiguous problems and stay accountable to outcomes, not just deliverables.

I have been working seriously in AI since 2019, with two published papers and production systems spanning LLM inference, agentic workflows, and retrieval at scale. I hold a GCP Professional Cloud Architect certification and have built on Google Cloud across both production client work and personal infrastructure I run and maintain myself.

What I am looking for is a team working at a scale I cannot replicate alone. I am comfortable going from a whiteboard conversation with a non-technical stakeholder to a systems design doc to a deployed service. I want to do that on harder problems, with people who will push back on my thinking.

I would love to bring that instinct to Google.

Best regards,

Devansh Parapalli
